Introduction

With lots of digitisation around, banks are under stress to open APIs, develop new applications for customers as well as employees around their core banking. Building new apps around core banking without proper understanding of OWASP top 10 security vulnerabilities like SQL Injection, Remote Code Execution, etc., might put the bank in higher risk zone. Whether the bank develops the application on its own or buys it, it is advisable for the bankers to understand the OWASP vulnerabilities, how do they manifest and what are the remedial measures. For majority of the attacks, bad programming is the sole source of problem. Security experts deploy remedial measures across the entire enterprise network stack right from web application firewalls, to end-point security. It is like making the outer wall stronger to secure the weak inner applications. None of these solutions is needed if the programs are written with security in mind.

Objective

To bring awareness about OWASP top 10. Discuss and demonstrate the remedial measures; Automated testing of applications; Code Scanning and Code Analysis.
