Automated Testing of Software Applications

March 11 – 15, 2019

Coordinator: **Dr. V. Radha**, Associate Professor, IDRBT

e-mail: vradha@idrbt.ac.in

Introduction

Every software development team tests their software before rolling out. Recent times witnessed Government emphasis on digitisation and reduced timelines to roll out new applications that led to less or no time for testing. Testing is a crucial step in a software development. Test engineers try to catch the bugs much ahead of application release but bugs always creep in and they often reappear, even with the best manual testing processes. Test Automation software is the best way to increase the effectiveness, efficiency and coverage of software testing.

Software tests should be repeated as and when source code is modified. With an automated testing tool, one can playback pre-recorded and predefined actions; compare the results to the expected behaviour and report the success or failure of these actions (test cases). Once automated tests are created they can easily be repeated and they can be extended to perform tasks impossible with manual testing.

Objective

To bring awareness about Automated Testing. Discuss and demonstrate automated testing, carrying out different test types, test case creation and performing load testing.
